

Setup a VM on Windows

.VirtualBox is a free and popular virtualization software that allows you to create and run virtual machines on your computer.

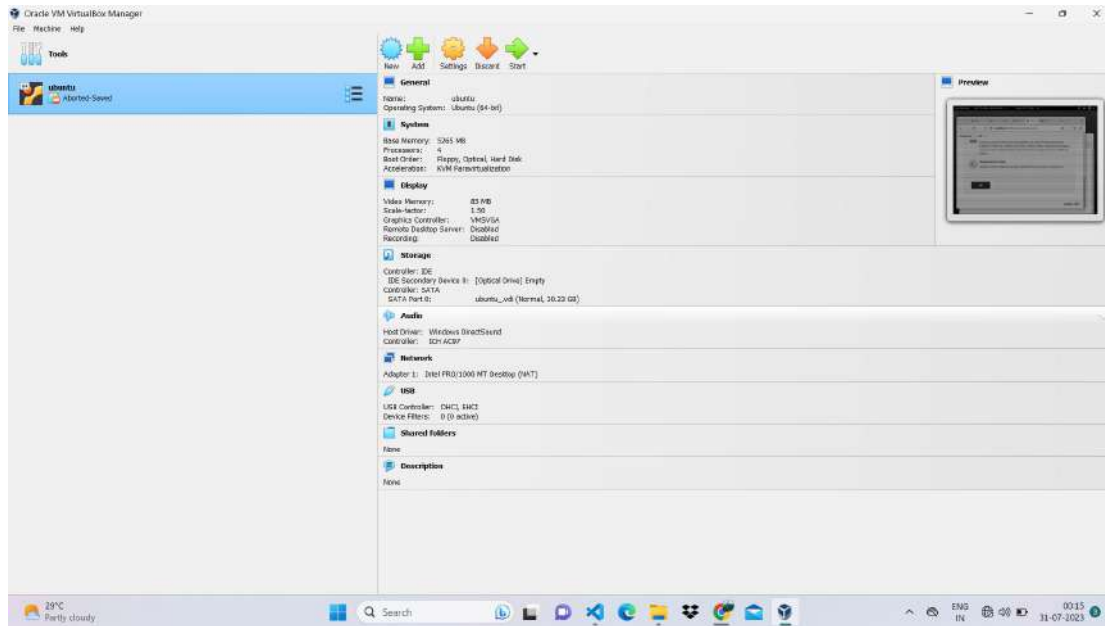

Step 1:

Make sure you have downloaded and installed VirtualBox on your system. You can find the latest version on the VirtualBox website.

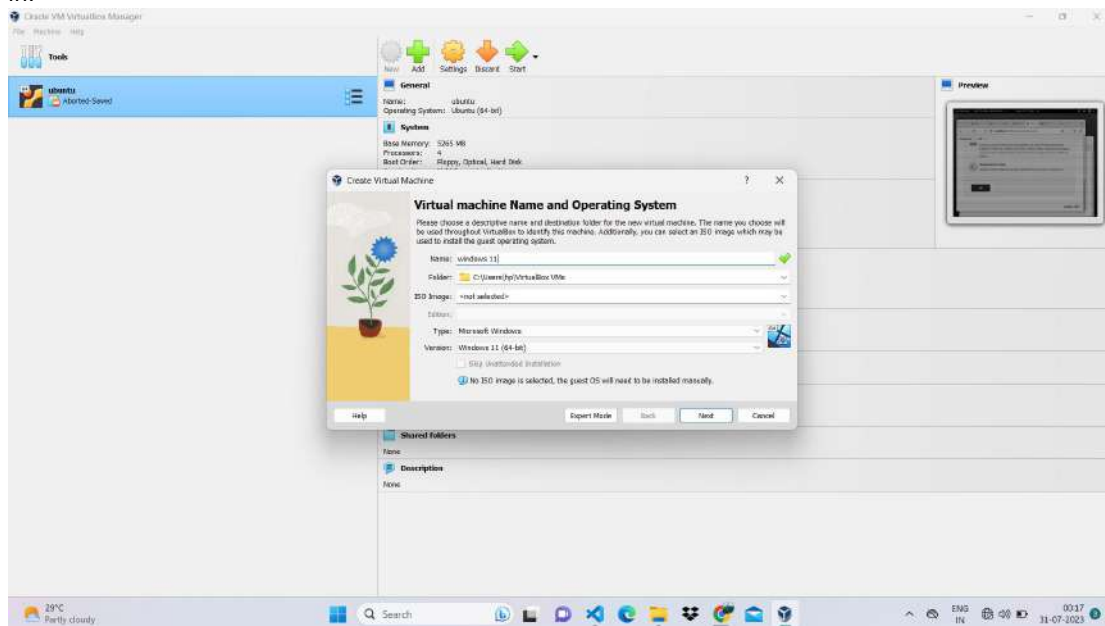

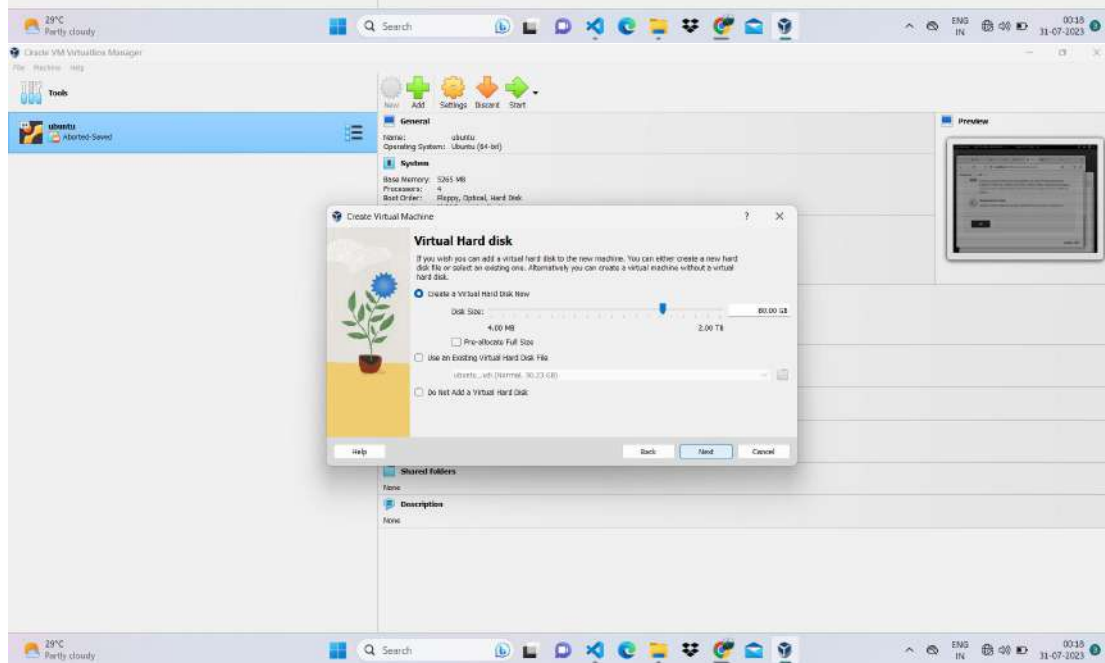

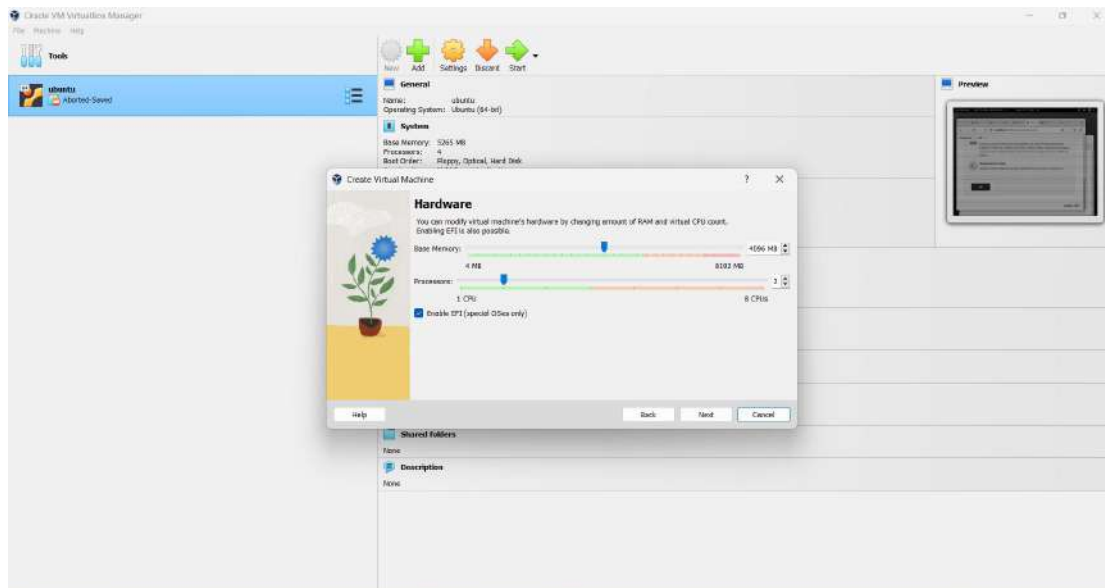

Once you have VirtualBox installed, download the windows 11 iso disk Image.

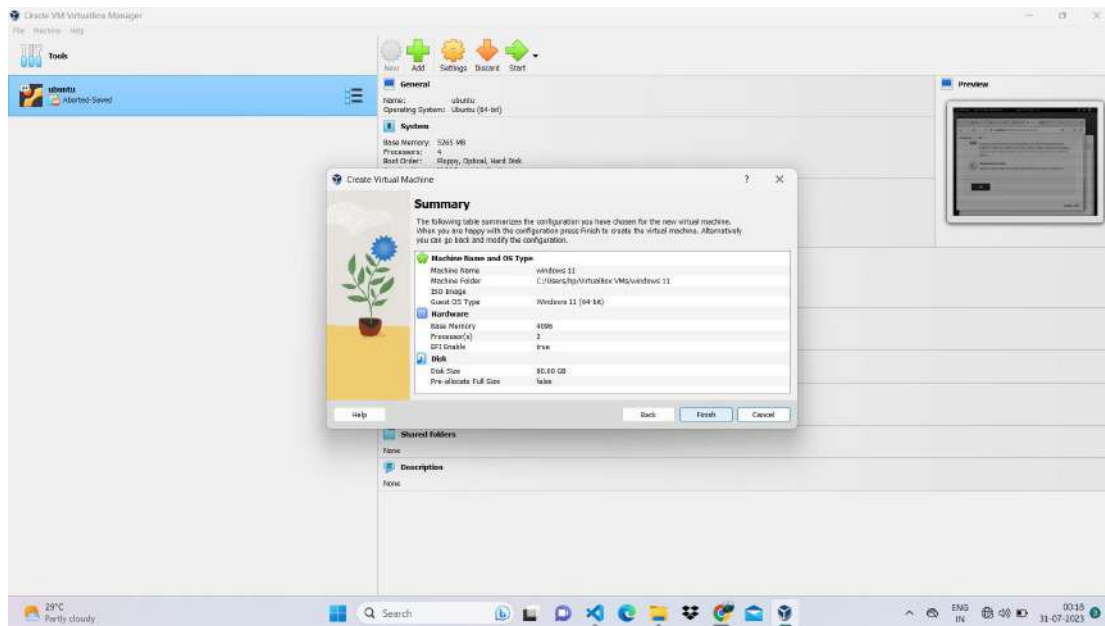

Click new.

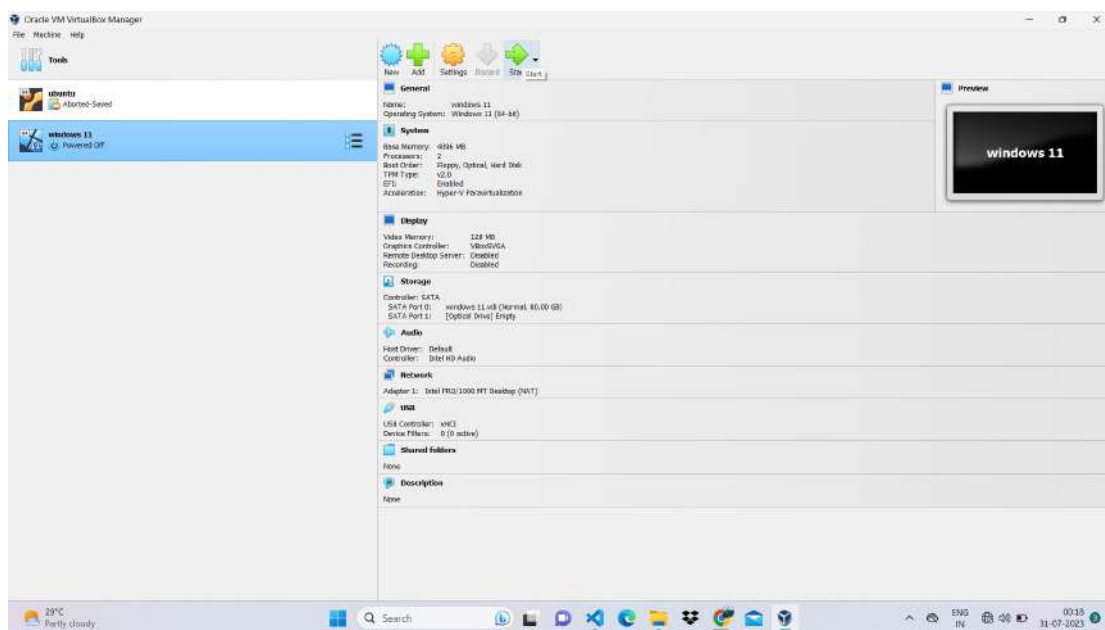

In the "Name" box, type the name of the OS you want to install. VirtualBox will guess the type and version based on the name you type in.

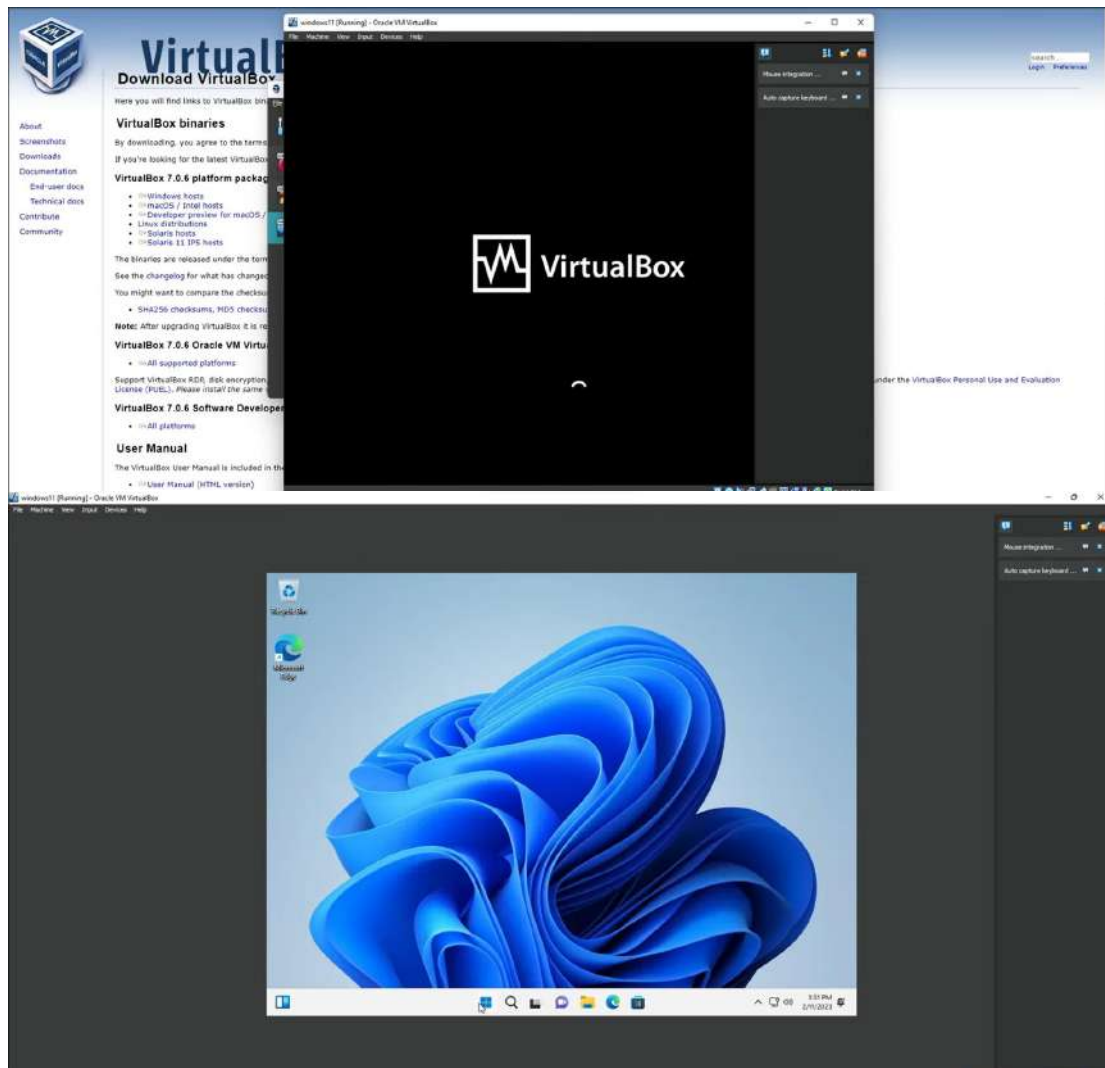

Once the virtual machine starts up, select the .iso image file you want to use.

The virtual machine will now boot from the ISO file, and you can proceed with the OS installation just like you would on a physical machine.

Congratulations! You now have a virtual environment set up using VirtualBox with the operating system of your choice. You can install any software, experiment, and use the virtual machine for various purposes without affecting your host system.
